PSYCHOTIC DISORDERS RESEARCH STUDY

We are recruiting individuals (18-30 years old) diagnosed with a psychotic disorder (schizophrenia, schizoaffective, schizophreniform, brief psychotic disorders) for a study looking at how the brain responds to sensory information.

For this study, you will be asked to complete computer tasks while we record your brain activity using EEG. EEG is a quick, non-invasive, painless method (pictured above). You will also be asked to participate in an interview asking about experiences, thoughts, and feelings you may have had.

Participants will be paid $15 per hour for their time. The study will take place over 2 visits, each lasting 3-5 hours. If you are interested, or know someone who might be, please contact us. We would be happy to provide additional information.
